

LED

LEDs meaning – MyChron5/MyChron5 2T

Question:

How can I interpret my MyChron5/MyChron5 2T LEDs behavior?

Answer:

Above, the possible MyChron5 LEDs behaviors are described, specifying each one's meaning:

- **Red LED 1, slow blinking + switched off display:**
It indicates the system has been started in Booter mode, not showing a normal behavior. In this case, it is suggested to update the device firmware, since it can be connected to the PC via Wi-Fi.
- **Red LED 1; slow blinking -> Red LED 1, fast blinking -> device switching off:**
this behavior indicates the good result of the firmware upgrade process (together with a displayed popup message).
- **Blue LED 1 + blue LED 2, fast blinking:**
at the first device switching on after the firmup process (above described), it indicates the internal GPS receiver firmup process, as well as the expansion modules one **only if any expansion is included into the AiM CAN net** (together with a displayed popup message).
