

LED

LEDs meaning – EVO5

Question:

How can I interpret my EVO5 LEDs behaviour?

Answer:

Above, the possible EVO5 LEDs behaviors are described, specifying each one's meaning:

- **Red LED, slow blinking (+ switched off display, if present):**
It indicates the system has been started in Booter mode, not showing a normal behavior. In this case, it is suggested to update the device firmware to recover the system, since it can be connected to the PC via USB or Wi-Fi.
- **Green LED, fixed:**
Indicates the system is correctly powered up with switched off WI-Fi.
- **White LED, fixed:**
Indicates the system is correctly powered up with switched on WI-Fi.
- **Yellow LED, fixed:**
Indicates the system is connected to the PC via Wi-Fi.
- **Red LED, slow blinking -> Red LED, fast blinking -> device reboot:**
this behavior indicates the good result of the firmware upgrade process (together with a displayed popup message, if present).
- **Blue LED, fast blinking:**
If presents, indicates the firmup procedure of the connected expansions, started by the EVO5.
- **Red LED, fixed:**
Indicates errors during the firmware upgrading procedure.
- **Blue LED, fast blinking:**
Indicates the overwriting of the transmitted configuration.
- **Cyan LED, fixed:**
Indicates the system is recording data.
